

1. the task is to:

- Point out (in a positive way) that the colleague spends too much time trying to find a perfect solution
- Explain that this causes delays and slows the team
- Encourage them to **move faster, experiment more, and improve through iteration instead of perfection**
- Focus on positive outcomes like faster progress, better learning, and stronger team impact
- Keep the tone supportive and encouraging, not critical

So basically: **give constructive feedback that encourages experimentation over perfection, highlighting benefits of change.**

We are currently working on improving how customers experience service speed and order accuracy in a busy food service environment, similar to what I have seen in my role at Subway where efficiency and customer satisfaction are key.

I want to share some feedback with you based on our recent teamwork. I really appreciate your focus on quality and making sure solutions are well thought out. That attention to detail is valuable and helps improve overall outcomes.

However, I've noticed that sometimes spending too much time trying to find the "perfect" solution before acting has slowed our progress. In a fast-paced environment like Subway, for example, we don't always have the time to perfect every step before trying a new process. When we tested small changes—like adjusting sandwich preparation flow or improving order-taking speed—we learned quickly what worked and improved it over time. This approach helped us serve customers faster and reduce waiting time.

I believe applying the same "test and learn" mindset here would really help. If we try simpler versions of ideas earlier and refine them based on feedback, we can move faster, reduce delays, and improve results more effectively.

Your strong focus on quality combined with a more experimental approach will make your contributions even more impactful and help the whole team succeed in a faster-moving environment.

2. Task 2

Your manager wants to implement lean methodology to help streamline some of your team's HR work. The challenge is that your team is new to the lean methodology, has never used a process mapping template, and has never performed process improvement or waste reduction this way. They aren't sure where to start! You all agree that it would be best to first try to apply lean methodology to a basic, non-work routine or process that you complete almost

every day. Your rationale is that doing so will help you all to better understand the mapping process, find a template that works for you, and practice identifying process improvement opportunities. They nominate you to be the first one to take on this task.

A simple everyday process I would choose to apply lean methodology to is **making a morning cup of tea/coffee and getting ready for work.**

First, I would map out each step in the process, such as:

- Waking up
- Going to the kitchen
- Collecting ingredients (tea/coffee, cup, milk, sugar)
- Heating water or starting the machine
- Preparing the drink
- Getting ready while waiting
- Cleaning up afterward

Once the process is mapped, I would look for any **waste or inefficiencies**, such as:

- Walking back and forth to collect items (motion waste)
- Waiting time while water boils or coffee brews
- Searching for items that are not kept in a fixed place

Then, I would identify improvements, such as:

- Organizing all tea/coffee items in one designated spot
- Preparing items the night before to reduce morning time
- Starting the kettle first before doing other tasks to reduce waiting waste
- Streamlining steps by combining tasks (e.g., preparing drink while getting dressed nearby)

By doing this, the team can clearly see how lean thinking helps identify unnecessary steps, reduce waste, and make even simple routines faster and more efficient. This will make it easier to apply the same approach to HR processes later, such as recruitment or onboarding workflows.

3. Value creates for company

1. Faster Decision-Making and Delivery

By shifting from “perfect before action” to “test, learn, improve,” the team reduces delays.

Value to company:

- Shorter cycle times for projects and HR processes
 - Faster implementation of improvements (e.g., hiring, onboarding, scheduling changes)
 - Increased responsiveness in a fast-paced service environment like food service operations
-

2. Reduced Operational Waste (Lean Impact)

Your morning coffee/tea process mapping mirrors real workplace inefficiencies (motion, waiting, searching, overprocessing).

Value to company:

- Identifies and removes non-value-added steps in HR workflows
 - Reduces wasted time and effort in repetitive processes (recruitment, onboarding, scheduling)
 - Improves process efficiency without additional cost
-

3. Improved Productivity and Throughput

When work is simplified and streamlined, teams complete more in less time.

Value to company:

- Higher employee productivity per hour
- Reduced backlog in HR tasks (e.g., approvals, documentation, hiring steps)
- More time available for strategic work instead of repetitive coordination

4. Better Employee Collaboration and Culture Shift

Your feedback encourages a “learning culture” instead of a “perfection culture.”

Value to company:

- Encourages psychological safety to test ideas quickly
 - Promotes experimentation and innovation at team level
 - Reduces fear of failure, increasing participation and engagement
 - Builds Agile/Lean mindset across HR and operations teams
-

5. Improved Customer Experience (Indirect but Critical)

In a Subway-like environment, internal efficiency directly impacts customer service speed and accuracy.

Value to company:

- Faster service times during peak hours
 - Fewer delays and mistakes in order handling
 - Higher customer satisfaction and repeat business
 - Better consistency in service delivery
-

6. Scalable Process Improvement Capability

Once the team learns lean mapping on a simple task, they can apply it to complex HR systems.

Value to company:

- Easier optimization of onboarding, recruitment, and training workflows
- Standardized approach to process improvement

- Long-term operational efficiency gains across departments
-

In one line (summary value statement):

This simulation builds a culture of **continuous improvement**, helping the company work faster, reduce waste, improve employee collaboration, and ultimately deliver better and more consistent customer experiences.
